Gesher Galicia’s Cadastral Map & Landowner Records Project:  A Virtual Recreation of a Vanished Province

Pamela A. Weisberger, M.S. ~ President, Gesher Galicia

Galicia, a former province of the Austro-Hungarian Empire, ceased to exist in 1918, but the cadastral maps created by the crown land’s cartographers provide an incomparable portrait of this historical region. In 2007, the international research group, Gesher Galicia (“the bridge to Galicia”) initiated the Cadastral Map and Landowner Records Project, resulting in several online platforms where mapping intersects with visual and metrical records to create a unique research portal.

Historical Background

The Kingdom of Galicia and Lodomeria was ruled by the Hapsburgs from 1772 – 1917. Its borders spanned what is now Eastern Poland and Western Ukraine. The territories acquired from the First partition of Poland resulted in the largest, and most populated, province of the Austrian Empire until the collapse of Austria-Hungary in 1918, when Poland regained control. In 1773, Galicia had about 2.6 million inhabitants in 280 cities and market towns: approximately 5,500 villages, plus hamlets, groups of houses and manorial farms. Approximately 75 – 80 percent of these communities had Jewish residents in sizeable numbers. There were nearly 19,000 noble families and the complicated relationship between the magnates, the peasants and the Jews are memorialized in the maps and records housed in European archives.

It was not just Galicia as an entity that disappeared. World War II eradicated most of the Jewish population. The encroachment of the Soviet Union changed the economic landscape. The noble families and their estates were soon gone and many Poles were repatriated back to towns within the new Polish borders. Nevertheless, the footprints of these “Galitzianers” are still found in the huge collections of cadastral maps and documents scattered between archives, libraries and repositories in numerous countries, all of which lay claim to a piece of almost-mythical Galicia.

Three distinct property surveys were conducted during the Austrian period of the 18th and 19th centuries. Upon gaining control of the region the crown commissioned the Josephine Cadastral Survey, between 1785 and 1788 and the Franciscan Survey, between 1819 and 1820. The Austrian Stabile Cadastral Survey of the 1830s to 1860s consisted of landowner records and detailed maps showing the smallest parcels of land, individual yards, houses, barns, roads, field plots, synagogues, cemeteries and even large trees. At least three versions of maps were created
including a field sketch (feldskizzen), a preliminary drafted version (indikationsskizzen) and the cadastral map in full color. At least one or more versions of these maps still exist for most locales and provide a view of the business, social and agricultural life of Galician communities. The comprehensive details of documents and maps facilitate modern reconstruction of the changing patterns of land use and ownership.

**The Gesher Galicia Project**

In the spring of 2007, Gesher Galicia began obtaining images of cadastral maps and landowner records from the Central State Historical Archives in Lviv, the State Archive of the Ternopil Oblast (Ukraine) and Polish State Regional Archives in Krakow and Przemysl and Rzesow. The project was established to introduce historians, genealogists and Holocaust researchers to the valuable information found on cadastral maps and to encourage research based on the merging of the data found in maps with “companion” records such as landowner, magnate, tax, school and voter records.

The project objectives were:

- to survey archival property records and maps for towns in Galicia resulting in a written inventory of these Fonds.
- to digitally photograph or scan cadastral maps for this region
- to digitize and/or index landowner records as companion pieces to the maps
- to create online portals to display high-resolution maps and search engines for the records.
- to annotate maps by merging data from records, personal testimonies, newspapers and ephemera to create a fluid portrait of a town, showing the evolution of a place in historical context: a cartographic timeline.

**Status Report**

**Inventory:** As of 2013 Gesher Galicia’s Galician Archival Records Project inventory has catalogued the cadastral and landowner holdings of over 150 towns, with over 1,700 record listings in our searchable inventory at: [http://inventory.geshergalicia.org](http://inventory.geshergalicia.org).

These records have been expanded to include voter, tax, magnate, tabula, governmental and school records. Any document with information tied to a resident, house, parcel or building
number that would appear on a cadastral maps is targeted for review, acquisition or indexing. The inventory database is searched by exact spelling, with a place list at the bottom of the page. Many communities with the same name, but in different districts, are delineated by administrative districts, which changed over the years.

Database:

The All Galicia Database (AGD) launched in 2011 at: [http://search.geshergalicia.org](http://search.geshergalicia.org) has over 230,000 records from 79 data sources from birth, death, marriage and divorce records to directories, school, voter, tax and landowner records from Galicia. These diverse community records cover all the ethnic/religious groups: Jews, Poles, Ukrainians, Ruthenians, Germans, Catholics, Greek Catholic and Orthodox. The application for this database is LeafSeek ([http://www.leafseek.com](http://www.leafseek.com)) created by Brooke Schreier Ganz, a tool that combines multiple datasets of different types — such as birth, marriage, and military records — into one unified searchable website and allows researchers to sort and find inter-connections in data. It offers built-in geo-spatial searches, pop-up Google Maps, Beider-Morse Phonetic Matching, name synonyms, and language localization. Using an API (Application Programming Interface) allows our site to access data related to our research from other research organizations.

Cadastral Map Room:

Created in July 2012 by Jay Osborn, images of maps are acquired, scanned or digitized with permission from collections in Austria, Poland, Ukraine, and the United States. Historic maps were often produced on multiple sheets, so we digitally “stitch” the images together and tile them to simplify web browser viewing. To display the maps online Osborn uses MapTiler/ GDAL2Tiles, Klokan Petr Pridal, GDAL and OSGeo. The original maps are the property of the source archives, but in most cases the stitched images and the Map Room viewer has been created by Gesher Galicia. The maps are grouped alphabetically by scale (regional or town), with a category of “specialty” maps including province-wide, rail, telegraph and voivodship maps. We are also adding “memory maps” (hand-drawn by former residents) and wartime/ghetto maps. Maps are uploaded as new images are collected and stitched.
Practical Application for Researchers

There are numerous reasons for academic researchers, sociologists, family historians and writers to include cadastral maps and property records in their repertoire of source documents, yet these remain an underutilized and overlooked resource. Problems are the inaccessibility of images, difficulty discovering or locating records and the lack of inventories and search engines. Gesher Galicia’s goal was to simplify the process by bringing the data to the researchers via our free, open-source Internet portal. An added benefit to our activities is the preservation of aging and fragile maps, which are subject to the vagaries of poorly equipped archives (mold, flood, theft, fire) by recreating them as single, easily viewable documents that can be examined in minute detail. (Most maps held in the archives were created in sections. It’s rare that one can access the details of an entire map in a single view, unless the pieces are laid out on the floor - a necessity given the size of most complete maps, often more than two square meters.) Used in combination with all types of written documents – vital, census, magnate, tax – maps provide the exact locations where people lived, worshipped and engaged in business. One can document an entire village from the names written in the margins or entered into plots of land. Maps provide a
road map of where the residents toiled in the fields, sold wares at the market square, washed clothes or frolicked in the rivers, or were buried. Maps and records also provide valuable data on many women who ran businesses in the rynek (market square) – names otherwise lost to history.

Magnate records found in libraries in Lviv, Krakow and Wroclaw can add a further dimension to research into the economics of land ownership and the relationships between the nobles and town residents. Dimensions can be added by making use of photographic documentation from the Austrian State Archives/Kriegsarchiv WWI photo collection.

The Future

Gesher Galicia plans to develop software to expand the capabilities of our Map Room and to collaborate with other digital/cultural mapping groups, with an eye towards annotating maps and adding interactive capabilities to our site. Using the Gesher Galicia historical map collection and growing records database as the foundation we will incorporate metrical data, photographs, historical newspapers, directories and eyewitness accounts to create a history that spans over a hundred years of a cadastral community’s life. The project development will have parallel paths involving digitization and acquisition along with the development of new applications to offer an online, interactive research portal for a variety of users. We hope to learn from other mapping cooperatives, like UCLA’s Hypercities, with its exploration of the historical layers of a city, to work towards making the past come alive. Add the element of social networking and crowd-sourcing, and we have a template to link cultures, languages, generations and international research communities by making innovative use of these archival cadastral map collections.
